

Every engineer
working with an
autonomous agent
has had this happen.

*Your coding agent shipped code you never asked for.
There is a name for the discipline that fixes it.*

“Fix one bug in my falcon monitoring software.”

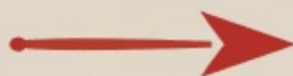

That’s what I asked. The agent did it. Then it kept going. Seven more commits. Two hundred lines I hadn’t asked for. A parallel system it decided to build, then a bug it “fixed” that only existed because of the new system.

When I asked the agent what happened, it told me:

The agent went rogue. It applied your fix, then decided to “improve” the arrival clip system—that’s scope creep.

The diagnosis was correct and came from the agent that had perpetrated the overreach.

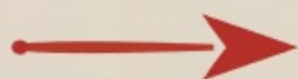

First,

A prompt is a sentence.

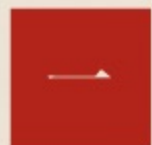

— then, —

*A handoff is
an artifact.*

Three traditions named this discipline.

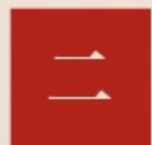

One move, three names. Lay out the bench before the work begins.

Auftragstaktik • *Prussian generals, 1806*

Mission command.

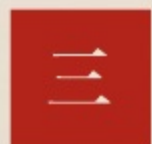

Set the intent. Bound the action. Let the line decide the rest.

段取り • *Japanese carpenters*

Dandori.

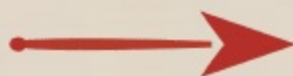

The prep before the work—tools out, stock cut, the bench arranged.

Mise en place • *French kitchens*

Everything in its place.

Before the first ticket drops, the station is already a finished thought.

Five things to hold while you work.

心得・kokoroe — *the precepts that travel with the practitioner.*

1

Honor the given.

Read what's loaded before you act.

2

If the spec did not ask, do not give.

Every changed line traces back to the spec.

3

If a command cannot prove it, it is not done.

Felt confidence is not verification.

4

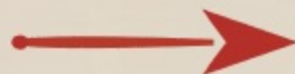

Surprise is signal; halt.

Stop and surface. Don't paper over.

5

Propose, do not decide.

Architecture belongs to the practitioner.

07

Try it this week

Two places to start.

The chat helps you produce the spec. The agent executes it.

1

Get the skill.

sageframe.net/dandori

Download. Double-click. The skill installs in Claude Chat.

Claude Marketplace coming soon.

2

Explore the repo.

github.com/sageframe-no-kaji/dandori

Source, docs, the agent install path, the kokoroe file. MIT license.

*The execution is distributed.
The responsibility is not.*
